ABSTRACT

The research includes the preparation of new azo-barbiturate dyes derived from shiff bases prepared by reaction Barbituric acid & phenlenediamine and repellency bases by means of double-reaction of repellant bases with different phenolic compounds. These compounds were diagnosed using infrared techniques, ultraviolet-visible radiation, NMR proton and thin layer chromatography. All barbiturate dyes had absorption between (273 – 310) nm and showed hypsochromic shift from the corresponding azo dyes. The crystal structures of barbiturate dyes indicated that barbiturate ring is sterically hindered by phenol rings.

Keywords: Barbituric acid, thymol, quinol, phenlenediamine.

Introduction

Barbiturates derived from an acidic basis are barbituric acid (1) and are characterized as medium to low acidity compounds with acidic function (7-8) (2). These compounds are not insoluble in water (3) and have been prepared to overcome this characteristic By reacting with sodium ions, which is prepared in the form of salts and becomes soluble in water (4). Several barbiturates were derived by substituting the roots in their basic construction, barbituric acid, which scientists agreed to number their atoms (5). These derivations include the radical substitution of ethels where hydrogen atoms on carbon 5 resulted in the discovery of the barbiton compound (6). The replacement of a vinyl root by the location of one of the ethel radicals on carbon 5 (in the barbiton compound) led to the discovery of phenobarbeton, which is characterized as antimicrobial (7) and muscle dysfunction (8). Replace the sulfur element with the oxygen element on carbon 2 and replace the side chain with the place of one of the ethyl radicals on carbon 5 (in the barbiton compound), resulting in the thiopantone compound (9). The radical replacement of the instance of the two hydrogen atoms associated with the azotone 1, 3 and the replacement of cyclohexanyl and the place of one of the ethyl radicals on carbon number 5.
resulted in the acquisition of sodium hexoparbeton (10). The latter two have the fastest impact, a group called azomethine (C = N-) (12 - 14). Also, shiff bases derived from aldehyde condensation with primary amines are called al-deamins. In the so-called shiff bases derived from the condensation of ketones with the primary amines are called al-katamines (15). The stability of shiff bases depends on the type of amine and the type of aldehyde or ketone used. The bases of the shiff prepared from the aromatic ketone and the aromatic amine are the most stable between the shiff bases. This is due to increased stability by resonance (16). Azumethin dyes are of great importance and wide use in industries Paper, colored reagents for food and cosmetics (17-21). Azumethin compounds are also bioactive, used as antimicrobial agents, cancer (8) and others (22-25).

Methods of work

All compounds were purified by re-crystallization followed by thin layer chromatography and modern spectral techniques. As for melting points, it was measured using Staurat MP / MP3. Infrared spectra were recorded using a spectrometer (Shimadzu FT-IR 8400 S) with a potassium bromide tablet. Absorption spectra were measured in ethanol using spectroscopy (Shimadzu UV-Vis. 1600) at Qadisiyah University - Faculty of Education. The proton NMR spectrum was taken using a BRUKER (300 MHZ) spectrometer in Jordan - Al-Bayt University. Chromatography was measured using Silica Gel TLC plates60 F\textsubscript{254}.

Methods of Preparation (26-28)

The general method for preparing the base of azomethin

In R.B.flask (100 ml), put 0.02 ml of PYRIMIDINE derivative and add 25 mL of pure ethanol and then (1 ml) gla. acetic acid, and gradually add (0.06 mol) aromatic amine with (20 ml) pure ethanol and then the mixture reflux for (2hr.) The reaction was followed by chromatography of the thin layer. After heating, the reaction mixture was cooled, the precipitate was then filtered and dried and then recrystallized using ethanol.
The general way to prepare azo pigments

Preparation of diazone salt sol.

In a glass baker, prepare a solution consisting of 10 mL cooled water and 10 mL concentrated hydrochloric acid and with continuous stirring (0.02 mL) of the prepared shiff base in the first part (A) with cooling in the ice bath (0-5 M), then add to it a coolant solution consisting of (0.06 mol) sodium nitrite + (5 ml) water.

In a second glass baker and - within the ice bath, a solution consisting of dissolving (0.06 mol) phenolic compound with (15 ml) sodium hydroxide solution (10%).

After continuous stirring in the ice bath, add the diazonium salt solution and drops to the coupling solution. After the addition of the mixture, stir the reaction mixture for 15 minutes in the ice bath. The deposited precipitate is washed with water and then recrystallized using ethanol.

Results and discussion (29-34)

This research included two steps:

The first step was to prepare a new shiff base (A) by reacting the condensation between barbituric acid and the 1,4-phenylene diamine compound, scheme number(1).

The second step involved the preparation of new azo dyes through the interaction of shigff base prepared in the first step using diazotation reaction with several phenolic compounds (scheme 2). Eight new azotecin derivatives were obtained (COMP.: A-H). Table (1) represents all physical properties
of prepared derivatives. Table (2) compounds (18). Spectra FT-IR represents all the spectral properties of the prepared compounds shows in Figures ((A - H))

\textbf{COMP.((D))} : 3.29 (s, 2 H), 6.98 (d, 2 H, \(J = 8.8\) Hz), 7.04 (d, 1 H, \(J = 8.6\) Hz), 7.22 (m, 7 H), 7.50-7.70 (m, 15 H), 7.76 (dd, 1 H, \(J = 8.2, 1.6\) Hz), 7.86-8.00 (m, 8 H), 8.11 (dt, 1 H, \(J = 7.8, 2.1\) Hz).

\textbf{COMP.((E))} : 3.23 (s, 2 H), 6.45-6.48 (m, 4 H), 6.83-6.87 (m, 4 H), 7.23 (m, 3 H), 7.31 (s, 11 H), 7.44-7.50 (m, 4 H), 7.67 (d, 3 H, \(J = 8.1\) Hz).

\textbf{COMP.((F))} : 3.08 (d, 1 H, \(J = 15.3\) Hz), 3.38 (d, 1 H, \(J = 15.3\) Hz), 6.45-6.48 (m, 4 H), 6.83-6.87 (m, 4 H), 7.23 (m, 3 H), 7.31 (s, 11 H), 7.44-7.50 (m, 4 H), 7.67 (d, 3 H, \(J = 8.1\) Hz).

\textbf{COMP.((G))} : δ 3.21 (s, 3 H), 6.48 (d, 1 H, \(J = 1.8\) Hz), 6.55 (d, 3 H, \(J = 1.1\) Hz), 6.68-6.71 (m, 4 H), 7.15 (m, 6 H), 7.21-7.31 (m, 12 H), 7.54 (d, 4 H, \(J = 8.2\) Hz).

\textbf{COMP.((H))} : 1.32 (d, 20 H, \(J = 6.8\) Hz), 2.08 (s, 3 H), 2.13 (s, 6 H), 3.27 (s, 2 H), 3.38 (h, 3 H, \(J = 7.1\) Hz), 6.68 (s, 2 H), 6.80 (s, 1 H), 7.20-7.29 (m, 7 H), 7.46-7.51 (m, 9 H), 7.63 (s, 1 H).

The NMR spectrum of the azoketimines indicates that there are several overlapping electronic environments of the prepared compounds due to the diversity of the active groups found in these compounds in that they are driving or drawing aggregates (such as azomethane, hydroxyl, amine and alkyl groups), in addition to the abundance and diversity of hydrogen atoms (6.60 ppm) refers to the adjacent protons of the base aromatic ring, whereas the signal (6.80 ppm) belongs to the opposite protons of the aromatic compound. The opposite protons of the aromatic amine compound, close to the azomethin group, show a clear signal with double bursts of 7.81 ppm. For the latter, they are due to the opposite protons of the base aromatic ring, especially near the fivering.
For the phenol compound, one of the most significant signs of the characteristic resonance characteristic is the signal (6.99 ppm) of the corresponding phenol ring protons, which at the same time are protons adjacent to the other phenol loop protons, causing double and double fissures. As for the naphthol dye, the most important signals are measured between the extended values (ppm 7.09 - 8.03), which are related to the protons of the alpha-naphthol ring, which are close to the hydroxyl driving group and the torso-tzo group, Hydrogen atoms. As for azumethane and pyrethylene, the presence of the high-density electron groups creates electronic environments that obscure or reduce the appearance of signals and thus reduce their measured values or observations. This is observed for these compounds,

**Conclusions**

The main objective of this research is to prepare new azotecins containing several phenolic derivatives using one of the important organic reactions, which is the reaction of azuna. The classical and modern techniques were used in the diagnosis of prepared compounds such as melting grades, chromatography, Ultraviolet-visual radiation, proton spectroscopy and NMR spectroscopy. The percentages of derived derivatives approximately good. We hope that our research will be done in the form of new azotecin dyes used in some industrial and applied fields such as dyes, various medicines, cosmetics, colored reagents and analytical chemistry guides.
